EPA Energy Star® Homes Certification Report

Date: December 9, 2007

To: Sophie Lane LLC

Plans ID: HRES-D7-1090

Robinson Farm

21 Curran Way, Unit 1 Somersworth, NH 03878

Dear Sophie Lane LLC:

Congratulations . . . I have completed the energy performance review of this new home and have determined that it meets the standards required to be labeled as an *EPA Energy Star® Home*.

This home was evaluated using the REM/Rate computer program developed by *Architectural Energy Corporation* of Boulder, Colorado. This program is the state of the art software in its field and has become the standard medium for determining a home's energy performance using the nationally recognized *Home Energy Ratings System (HERS)* program. This software is also used as the basis for determining if a home meets the required standards to be labeled as an *EPA Energy Star® Home*.

As you review this report, please remember that the results are not a precise prediction of overall energy consumption or utility bills, but rather a guide to compare energy costs between a number of house configurations, similar to the "miles per gallon" guide for automobiles. The program includes "average" values for numerous factors that can affect home energy usage such as weather patterns, number and living habits of the occupants, hot water usage, lights and appliance usage, thermostat settings, and certain details of construction. In a particular house, any of these factors can vary significantly from the assumptions made.

This report is based on the first floor and full basement as conditioned living space.

Important Comments & Suggestions:

 A Blower Door test was performed on this home to measure the number of times it naturally expels and replaces its internal air volume. Over the past 10 years the Blower Door has become the national and international standard method of evaluating and measuring the infiltration characteristics of a dwelling.

The Blower Door test I performed on this home measured the natural air change per hour rate at .09 ACHn.

- It is Critically Important that you develop a strategy to properly ventilate this home for both Indoor-Air-Quality and long term Building Durability (moisture) reasons. Current ASHRE 62.2 national ventilation standards recommend that you operate the bathroom exhaust fan (s) at a minimum continuous rate of 57 cubic feet per minute (cfm) 24 hours per day. (See attached Air Leakage Report)
- Important If you have, or will install combustion appliances in this home, hard wired or plug-in Carbon Monoxide Alarms should be installed on each floor as per manufacturers instructions.

- The HVAC equipment specifications used in the REM/Rate model are based on the designed performance factors of that equipment. Any deviations in actual performance from those design specifications in your home are Warranty issues that are the sole responsibility of your Heating/Cooling design, and installation contractors.
- It is strongly suggested that as the homeowners you install one or two layers of simple window coverings to the full height of the window units and the patio doors. A strategy of covering as much of the window glazing as possible on cold winter nights and hot summer days will significantly increase both winter and summer comfort and reduce energy usage.
- Develop a strategy to install compact fluorescent light bulbs, starting with the light fixtures that are used the most hours per day.
- Install low flow aerators and shower heads.
- Develop a strategy to purchase Energy Star Rated appliances and electronic devices.

Enclosed please find your official *Energy Star® Labeled Home* certificate that can be framed or filed with your other important documents. Also enclosed is an *Energy Star® Labeled Home* sticker that should be attached in a permanent location of the home such as the electrical entrance box.

Thank you for using *Horizon-RES* as your *EPA - Energy Star® Homes* Ratings Partner. Please feel free to contact me at any time if you should have questions.

Best Regards,

Kevin Hanlon Residential Energy Consultant

Home Energy Ratings System (HERS) Report

In 1992, Congress instructed the US Department of Energy (DOE) to work with the US Department of Housing and Urban Development (HUD), and the lending industry to develop a nationally recognized uniform system to measure and rate the energy performance of new and existing dwellings. In 1995 DOE published these guidelines and they have been gradually taking hold around the country. Starting in 2006, the revised method rates a home on a scale of 0 to 100 with 0 being a highly efficient home and 100 being a house that is built to the energy code minimum. The system is based on comparing the house being rated, referred to as the design house, to a computer model of the exact same house if it were built to minimum current energy use standards, referred to as the reference house. A score of 100 would be a house which meets current energy consumption standards. For ease of understanding, the scale can also be converted to a "star" system as follows:

* * *

An index of 100 is a house built approx to the IECC 2004 National Energy Code.

In this region:

An index of 80 or LESS, along with other requirements, is necessary to achieve the Energy Star label.

HERS Index, Star and Efficiency Scales for Rated Homes

HERS Index Range	Stars (With			gy Efficienc rence Home	
500 - 401	*	500%	to	401%	Less Efficient

ASHRAE 62.2 - 2003 Ventilation Requirements

For this home to comply with ASHRAE Standard 62.2 - 2003 Ventilation and Acceptable Indoor Air Quality in Low-Rise Residential Buildings, a minimum of 57 cfm of mechanical ventilation must be provided continuously, 24 hours per day. Alternatively, an intermittently operating mechanical ventilation system may be used if the ventilation rate is adjusted accordingly. For example, a 113 cfm mechanical ventilation system would need to operate 12 hours per day, as long as the system operates to provide required average ventilation once each hour.

ENERGY STAR Mandatory Requirements

X Thermal Bypass Inspection Checklist *	X ENERGY STAR Products *
X Ductwork Requirements	X ENERGY STAR Scoring Exceptions

This home MEETS OR EXCEEDS the energy efficiency requirements for designation as an EPA ENERGY STAR Qualified Home.

Pollution Prevented Energy Cost Savings (\$/year)

Type of Emissions	Reduction (lb/year)	Heating:	\$1205
Carbon Dioxide (CO2)	6513.2	Cooling:	\$113
Sulfur Dioxide (SO2)	9.7	Water Heating:	\$27
Nitrogen Oxides (NOx)	10.7	Lights & Appliances:	\$201
		Total:	\$1546

The energy savings and pollution prevented are calculated by comparing the Rated Home to the Reference Home as defined in the "Mortgage Industry National Home Energy Rating Systems Standards" as promulgated by the Residential Energy Services Network (RESNET). In accordance with these guidelines, building inputs affecting setpoints, infiltration rates, window shading and the existence of mechanical systems may have been changed prior to calculating loads.

^{*} Thermal Bypass Checklist and ENERGY STAR Products are not checked in REM/Rate at this time.
